

Quilt Shop Spinner Instructions

designed by Judy Ferguson

1. Glue the four posts together as shown in the top view.
2. Glue the wood panels to the post assembly as shown in the top view drawing, with the top of the panels flush with the top of the posts.
3. Glue the "pegboard" panels to the wood panels. There should be about 1/16" of the wood panel showing on the top, bottom and outer edges.
4. Drill a hole in the center of the base to accommodate the short piece of brass tubing and glue the tubing into the base. It should fit very snugly.
5. Glue the long piece of tubing into the long one.
6. Slip the completed post and panel assembly over the brass tubing. It should rest on top of the short piece of tubing. If it slips down too far, glue a sliver of wood in the hole in the center of the post. Don't glue the tube in if you want it to spin freely.
6. Glue a hat pin or a bead on the top sticking the pin down the tube.
7. Shorten straight or sequin pins to about 3/16", drill small holes where desired in the pegboard, and glue the pins in for peg hooks.

Note: I used plastic canvas from Michael's that is close to scale for pegboard, or perf board from Radio Shack could be used. I used K & S brass tubing 1/8", and another piece of tubing that would slip into it.
